

WEBSITE The Setup Guide

You commented WEBSITE — here's the tool. It's scroll-world: a Claude Code skill that turns any brand into a scrollable, fly-through 3D world (like those Apple scroll-through landing pages).

Free skill, MIT, 4.5K+ stars.

Repo: <https://github.com/oso95/scroll-world>

What it actually is

An agent skill (Claude Code, Codex, and any SKILL.md-compatible agent) that builds an immersive "fly through the world" landing page. As you scroll, a camera flies from *outside* each scene *into* its interior, then flows on to the next — no cuts, one continuous flight through a little generated world. The same scroll-scrubbed technique behind Apple's product pages: the camera genuinely moves, scroll just drives time.

Why it's cool

This is the kind of premium web experience that normally takes a specialist studio. scroll-world gives you the whole pipeline — art generation, camera flights, and a portable scroll engine — from one skill. It's framework-agnostic: the output drops into plain HTML, Next.js, Vue, or a Python-served page.

Honest heads-up: this one costs money to run

Unlike most skills I share, scroll-world isn't free to generate with. It uses the **Higgsfield CLI (with credits)** to create the scene art and camera videos. Roughly, for N scenes you get about N image generations + ~2N-1 video generations (a mobile version doubles the video gens). The skill estimates the cost against your live balance and asks you to approve *before* it spends anything — but budget for it. If you have a ChatGPT/Codex subscription, stills can optionally be generated through Codex's image model instead.

What you need

An agent that supports skills (Claude Code recommended) · the **Higgsfield CLI**, logged in, with credits · **ffmpeg** / **ffprobe** (for frames + encoding) · **Python 3 with Pillow** (for the mobile portrait version). Optional: the Codex CLI if you'd rather bill stills to a ChatGPT subscription.

Setup

1. Install the skill.

Claude Code (plugin — recommended):

```
/plugin marketplace add oso95/scroll-world
```

```
/plugin install scroll-world@scroll-world
```

Codex / other agents (skills CLI):

npx skills add oso95/scroll-world

2. Install the requirements. Make sure ffmpeg and Python+Pillow are installed, and log into Higgsfield:

higgsfield auth login (and add credits)

3. Invoke it. In Claude Code, run /scroll-world or just ask for "a scroll-through world landing page." In Codex, use \$scroll-world.

4. Do the interview. The skill asks for your subject/industry + pitch, a brand kit (import from a URL, hand it over, or have it proposed), art direction, the ordered scenes the camera visits, whether you want a mobile 9:16 version, and your budget — with estimated credit costs shown for approval.

5. Let it generate + wire it up. It creates one still per scene, a "dive-in" clip per scene, and the connector clips that seam them together, then wires it all into a scroll engine that plays as one flight (serving portrait clips on phones if you opted in).

What to try first

- ☐ Watch the demo on the repo so you know the target look
- ☐ Install the skill + requirements
- ☐ Log into Higgsfield and check your credit balance
- ☐ Run it with a small number of scenes first (cheaper test)
- ☐ Approve the budget estimate before it generates
- ☐ Drop the output into a plain HTML page to preview

An honest note

The result looks genuinely high-end — but two real caveats. It **costs Higgsfield credits** every time you generate, so treat it like a paid tool and start small. And image/video generation takes a while (it runs in the background and polls). If you're okay with a paid, slightly technical setup, the payoff is a landing page that looks like a studio made it. Start with a few scenes, see the quality, then scale up.
